/ About Me

My name is **Ishanika**, and I'm a **recent graduate** from the **Auckland University of Technology!** I have a **Bachelor of Computer and Information Sciences**, majoring in **Software Development** with supplementary focuses minoring in **Digital Communication**. I'm passionate about the intersection of design and technology, especially when it comes to building intuitive, engaging, and well-crafted web experiences. I enjoy turning ideas into interactive designs, experimenting with 3D work, and growing my visual communication skills. I also have experience with programming languages such as **Python**, **JavaScript**, and **Java**, which support my ability to design with technical awareness.

Here are some softwares I have been working with:

- Adobe Creative Cloud (Photoshop/Illustrator/InDesign)
- Figma (UI Design)
- DaVinci Resolve (Video Editing)
- Blender (3D Modelling)
- Unity (Game Development)
- Visual Studio Code (Programming)

Outside of work, I'm a little nerdy about art, love literary fiction, occasionally indulge in random sports, and play way too many video games.

The Top Coffee Producers 2024

Fun Facts:

Brazil produces almost a third of the world's coffee and has been producing it for over 150 years.

Coffee trees can live for up to 100 years and take around 5 years to mature.

Decaf coffee still contains some caffeine, though significantly less than regular coffee.

/ UX / UI Case Study

Project Name: WorkSafe NZ Programme Visualization (Collborated Project)

User Goals:

- Improve visibility of internal projects.
- Align tasks and personnel with strategic principles.
- Communicate project status and dependencies clearly.
- Prevent project disruptions due to personnel changes.

Role: UX Research, Wireframing, UI Design

Tools: Figma, Canva (For Diagrams)

Duration: 11 weeks

Background:

WorkSafe New Zealand is the national regulator for health and safety. They need to modernise their approach for managing the internal projects across teams, as it has become apparent that the current way that WorkSafe projects and efforts are visualised is not enough.

They require a simple and intuitive tool that is able to collate and visualise their strategic initiatives and how tasks are broken down across the organisation.

Primary User: Project managers at WorkSafe New Zealand.

User Goals:

- Improve visibility of internal projects.
- Align tasks and personnel with strategic principles.
- Communicate project status and dependencies clearly.
- Prevent project disruptions due to personnel changes.

Pain Points:

- The user struggles with efficiently managing resources, especially during overlapping projects or sudden staff changes.

Problem Statement:

Project Managers at WorkSafe New Zealand are experiencing a lack of visibility into project dependencies due to the absence of a visualisation tool. This is leading to project disruptions and delays when personnel changes occur, as critical dependencies are not easily identified.

Addressing this problem is crucial as it will improve efficiency, reduce risks, and enhance decision-making, supporting WorkSafe NZ's mission as a world-class health and safety regulator.

Ishikawa Diagram

Process Chart

Hierarchical Task Analysis

Initial Wireframes:

Wireframes Process:

The wireframes were designed to improve visibility of internal projects by introducing an initial dashboard that visualises project timelines, task ownership, and dependencies across teams. By mapping projects and personnel in a structured interface, project managers can quickly identify overlapping workstreams and critical dependencies.

This structure begins to explore how tasks and responsibilities could be more easily reassigned if personnel changes occur, helping reduce potential disruptions and support project continuity. As early wireframes, the layout focuses on establishing a clear and accessible structure for visualising project progress, dependencies, and task ownership. These concepts will continue to be refined and iterated on to better support project managers in aligning tasks with strategic initiatives and making informed decisions.

Version One Prototypes:

As a team, we developed three user personas and analysed key tasks such as supporting employees who need assistance, addressing initiative delays caused by staffing changes, and removing employees from initiatives. Using a needs and cognitive acts table and a user journey map outlining actions, goals, emotions, thoughts, pain points, and opportunities, we identified critical user insights that informed the design and development of the final product.

Our Solution:

- When the Project Manager first opens the application, they'll be able to search for employees and initiatives immediately

Pain Points Tackled:

- Easily able to search for initiatives as soon as the program is opened

Timeline View:

- Three views for different user preferences: Gantt chart view, project backlog view, and completed tasks view.
- Detailed Project Details: Dependencies, team members, budgets, and skills required.
- Visual dependency arrows : clearly shows task relationships
- Familiar timeline format: users are easily able to read the chart

Pain Points Tackled:

- Manager cannot see easily what the impact of removing an employee is.
- Hard to see what skills are required for each task.

Employee Management:

- Drag and drop reassignment: Engaging, intuitive interaction
- Dependency protection: prevents problematic employee removal
- Skill based filtering: ensures capable replacements
- Real time warnings: warnings disappear when issues are resolved

Pain Points Tackled:

- The manager cannot easily see what the impact of removing an employee is.
- It's hard to see what skills are required for each task.
- May be tedious to search for an employee with required skills.
- It can be tedious to transfer each task over to a different employee.
- Entire process may take a while to complete

Key innovations vs conventional designs:

- Interactive drag and drop rather than form based reassignment
- Preventative dependency checking rather than reactive problem solving
- Integrated skill matching rather than a separate database
- Smart warning system rather than static notifications

Users can quickly identify issues, make informed decisions, and resolve problems while maintaining project integrity, helping prevent initiative delays and streamline team management.

Final Outcome

Lessons Learned

- Gained a deeper understanding of user-centred design through real-world problem solving.
- Learned the value of early sketching, prototyping, and iterative feedback.
- Improved collaboration and communication within a multi-skilled team.
- Balanced creativity with clarity in designing effective visualisations.
- Used design thinking to guide decisions and stay focused on user needs.
- Discovered the importance of presenting and justifying design choices with evidence and theory. Realized the power of user personas in grounding design decisions.
- Understood the impact of good UI/UX on stakeholder communication and project visibility.

Stardew Valley - The Stardrop Saloon Recreation

3D Modelled the Stardrop Saloon from the video game Stardew Valley as part of a collaborative project developed in Unity. Working within a team, we recreated the iconic location as a navigable 3D environment while preserving the nostalgic atmosphere of the original setting. My role focused on modelling environmental assets, including furniture, interior props, paintings, and digital artwork that enhanced the scene's visual detail and authenticity.

Blender Guru - [Beginner Blender Tutorial \(2026\)](#).

Recreating the 2026 donut tutorial by Blender Guru allowed me to develop a foundational understanding of Blender's 3D workflow. Through this project, I gained hands-on experience with modelling, materials, lighting, and rendering while learning how small adjustments in texture and lighting significantly impact the final visual outcome. I am currently creating additional independent 3D modelling projects to further develop my workflow and technical skills in Blender.
